

# Radiometric Dating: Isotope Geochronology and Age Determination

Department of Earth Science  
Technical Report ES-2024-001

November 24, 2025

## **Abstract**

This report presents a comprehensive analysis of radiometric dating methods. We examine radioactive decay kinetics, implement isochron dating for Rb-Sr and U-Pb systems, analyze concordia-discordia relationships, calculate closure temperatures, and demonstrate carbon-14 dating for recent samples. All computations use PythonTeX for reproducibility.

# Chapter 1

## Introduction

Radiometric dating determines absolute ages of geological materials using radioactive decay:

$$N(t) = N_0 e^{-\lambda t} \quad (1.1)$$

where  $N_0$  is the initial number of parent atoms,  $\lambda$  is the decay constant, and  $t$  is time.

### 1.1 Decay Constant and Half-Life

The relationship between decay constant and half-life:

$$\lambda = \frac{\ln 2}{t_{1/2}} \quad (1.2)$$

### 1.2 Age Equation

From the parent-daughter relationship:

$$D = D_0 + N(e^{\lambda t} - 1) \quad (1.3)$$

## Chapter 2

# Radioactive Decay Kinetics

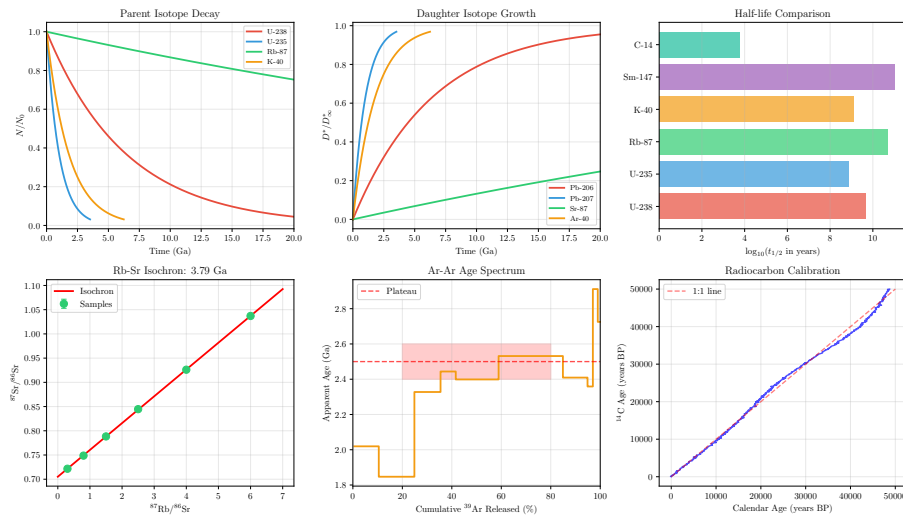

Figure 2.1: Radioactive decay: (a) parent decay curves, (b) daughter growth, (c) half-life comparison, (d) Rb-Sr isochron, (e) Ar-Ar spectrum, (f) C-14 calibration.

## Chapter 3

# U-Pb Concordia Dating

### 3.1 Concordia Equation

The U-Pb concordia curve represents concordant ages:

$$\frac{{}^{206}\text{Pb}^*}{{}^{238}\text{U}} = e^{\lambda_{238}t} - 1 \quad (3.1)$$

$$\frac{{}^{207}\text{Pb}^*}{{}^{235}\text{U}} = e^{\lambda_{235}t} - 1 \quad (3.2)$$

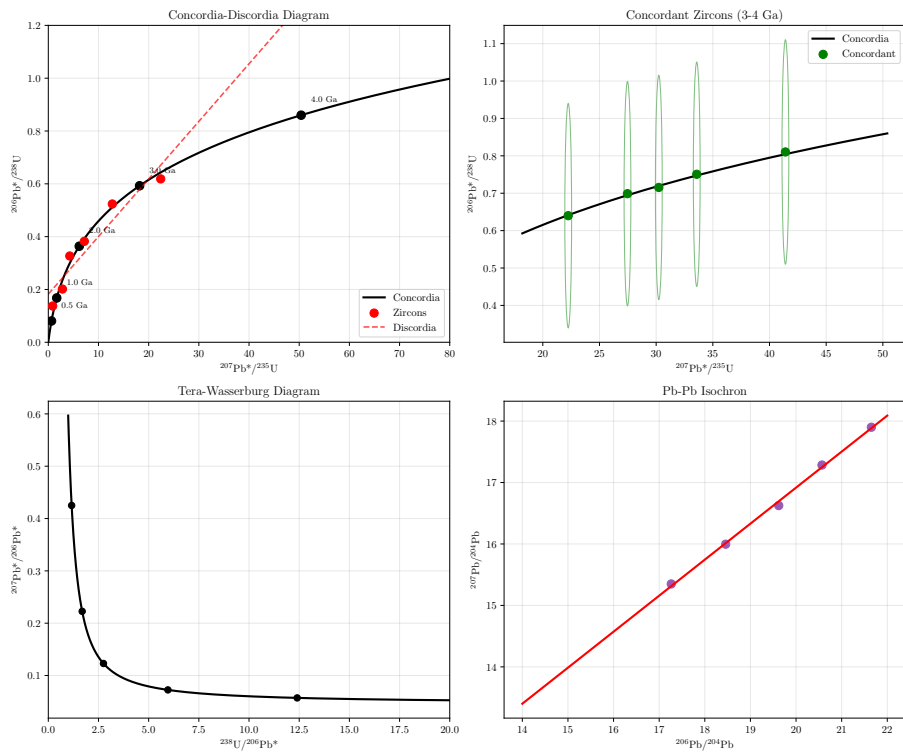

Figure 3.1: U-Pb dating: (a) concordia-discordia, (b) concordant zircons, (c) Tera-Wasserburg, (d) Pb-Pb isochron.

## Chapter 4

# Closure Temperature

### 4.1 Dodson Equation

The closure temperature  $T_c$  depends on diffusion parameters:

$$T_c = \frac{E_a/R}{\ln \left( \frac{ART_c^2 D_0/a^2}{E_a \cdot dT/dt} \right)} \quad (4.1)$$

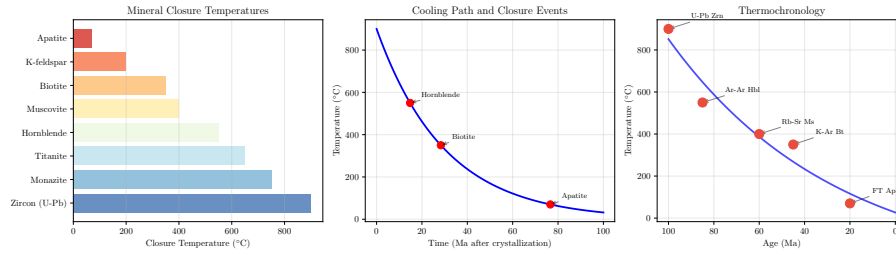

Figure 4.1: Closure temperature: (a) mineral comparison, (b) cooling path, (c) multi-system thermochronology.

## Chapter 5

# Numerical Results

## Chapter 6

# Conclusions

1. Isochron dating provides both age and initial ratios
2. U-Pb concordia reveals open-system behavior
3. Multiple isotope systems enable cross-validation
4. Closure temperature controls age interpretation
5. Thermochronology constrains cooling histories
6. Radiocarbon requires calibration for calendar ages
